

AX RF

AX RF

Access control terminal with integrated
RF reader and button

AX RF is a modern and stylish design terminal, which ensures high safety standards. Easy to install and to configure, it controls doors and alarm systems choosing among different levels of security, thanks to the many possible configurations.

FUNCTIONALITIES

AX RF is a unique stand-alone high security doors opening and managing alarm center terminal, which uses the most advanced technologies for the identification and security, all integrated into a BTicino 503 box.

The button, round with multicolored LEDs, actuates the internal relay that can be used, for example, for the activation of a doorbell. The system is completed by a buzzer beeps.

The device allows to control even the most complex security systems with the possibility to control up to three optional cards (**AX MAX**) with encrypted communication. Each card **AX MAX** has 2 inputs and 2 relays and it can be placed in a secure location ensuring the highest security standards.

All the reports (alarm on) are made by a light and/or acoustic signal. It is even possible, with the **Night & Day** functionality to manage, depending on the time of day, different levels of security, or assigning, depending on the subject, different access permissions or control of the alarm.

All the configuration operations and recording and deletion of users are made using special cards (**MASTER**) and the lighted button; in stand-alone mode **AX RF** ensures maximum ease of configuration, thanks to special programming adapters provided in the kit.
